Factors Related to the Number of Antral Follicles on In-Vitro Fertilization (IVF)

Faktor yang Terkait dengan Jumlah Folikel Antral pada Fertilisasi in Vitro

Abstract

Objective: To determine factors which are related to the number of antral follicles on infertile patients.

Method: This cross sectional study was conducted in In-Vitro Fertilization (IVF) clinic of Graha Tunjung, Sanglah hospital, Bali. All fertile patients following the IVF program were calculated the number of antral follicles in both ovaries using transgene USG. This sample was recruited by random sampling from April 1st, 2001 to April 30th, 2011. We analyzed the data using Chi square test through SPSS for Windows 17.0 version.

Result: Of 102 samples, the mean of patients’ age was 32.9% (SD 4.6) years old. From 72 patients (70.6%) experienced above 3 years of infertile period, the primary infertile was on 69 patients (67.7%). There was a relationship between patients’ age and the number of antral follicles significantly (prevalence ratio (PR) 1.41; 95% CI 1.11-1.79). Meanwhile, the number of antral follicles and type of infertile (PR 1.02; 95% CI 0.76-1.37) also infertile period (PR 0.95; 95% CI 0.72-1.27) were not associated significantly.

Conclusion: Patients’ age has an association with the number of antral follicles on IVF.

Keywords: age, infertile, infertile period, number of antral follicles and type of infertile

INTRODUCTION

Infertility is defined as not getting pregnant (conceive) after one year of unprotected intercourse. Nowadays, it becomes the concern of many married couple. A survey conducted by Statistics Centre Agency in 1995, the infertility rate in Indonesia was 12%.

Assisted Reproductive Technology (ART), especially in-vitro fertilization (IVF) or well-known as "test tube baby" is one way to solve the infertility in advanced. Unfortunately, there are several factors influencing the success of this IVF such as age, infertility period, and type of infertility.1,2

The advanced technology in IVF has enabled us to assess how much the possibility of success gained on every patients and it can determine the proper time to follow the program. It is very important to perform a diagnostic examination based on evidence based to escalate the chance to get pregnant. The easy and important examination to predict the success of stimulating ovarian is the number of antral follicles. Meta-analysis study reported that the number of antral follicles was an excellent predictor in ovarian stimulation. The increase of age was associated with the number of antral follicles; however, study carried out in San Francisco rejected this statement.1,3,4
According to the previous results above, this study aims to determine factors contributing to the number of antral follicles to increase the success rate of IVF.

METHOD

This cross sectional study was conducted in IVF clinic of Graha Tunjung, Sanglah Hospital, Bali. All fertile patients following the IVF program were calculated the number of antral follicles in both ovarian using transgene USG. This sample was recruited by random sampling from April 1<sup>st</sup>, 2001 to April 30<sup>th</sup>, 2011. We analyzed the data using Chi square test through SPSS for Windows 17.0 version.

RESULTS

Of 102 infertile patients joining to the IVF program in IVF Graha Tunjung Sanglah Hospital Bali, the mean of age was 32.9 (SD 4.6) years old and the infertile period was 6.1 (SD 4.0) years.

Table 1 explained the relationship of age, type of infertile, and infertile period with the number of antral follicles on IVF. From Chi-square test, only age had association with the number of antral follicles with prevalence ratio (PR) 1.41 (95% CI 1.11-1.79; p=0.016).

DISCUSSION

The result showed that 45 patients (44.1%) younger than 36 years old had less than 10 antral follicles on IVF and only 29 patients (28.4%) had more than 10 follicles. Other study pointed out that the number of antral follicles on young female was 3-11 per ovarian. Antral follicles calculated for superovulation process on both ovarian were the primordial follicles which would be developed to become a mature follicle. The ideal number of antral follicles on both ovaries after IVF was 11-30 follicles; less than 5 follicles signed poor response and more than 30 follicles indicated excellent response.

The older the patients are, the less possibility to get conceive. A study revealed that before 24 years old, the fertility rate of women reached 100% and it decreased gradually as the increase of age and finally, after 50 years old, the fertility rate became 0%. Another study showed that women would experience the decrease of fertility at 37.5 years old, whereas the pregnancy rate over 1 year under 31-year-old women was 74% and they fell into 54% above 35-year old women<sup>1,3-7</sup>. This fact is due to the lack number of primordial follicles. The acceleration loss of follicle occurred at 37 years old and raised after 10 to 12 years of menopause. The number of antral follicles sized ≥ 2 mm which was assessed by transvaginal USG decreased 60% between 22 and 42 years old. In accordance with the number of antral follicles, the ovum quantity and quality was worsened started from 30 years old and much more after 40 years old.

The impaired of fecundity increased from 2% at the age of 15-19 years old to 28% at the age of more than 35 years old<sup>6</sup>. The decrease number of antral follicles was in parallel to the decrease in the quality of the oocyte. Similar study had been conducted showing that there was a relationship between age and the number of antral follicles, which there was a decrease in the number of antral follicles from 0.35 to 0.95 per year. According to a study in India, it had been found that the difference in the number of antral follicles were associated with age probably because there were differences in race and geography of the region. There was a significant decrease in fertility in line with the increase of age. Around 11% women did not get

pregnant after 40 years old and 87% was infertile at 45 years old.8-11

The result from this study revealed that the type of infertility did not affect the number of antral follicles as either primary or secondary infertility in married couples. It was clearly showed that the number of antral follicles did not have an association with the type of infertility because one year did not describe how long the couple was married and tried to get pregnant. It could happen at 25-year-old women who would not like to have a child after one year of marriage although they had good number of antral follicles. Apart from that, other same age women who suffered from diseases, for example Polycystic Ovarian Syndrome (PCOS), had many number of antral follicles, but it looked the small size. The duration of infertility did not provide information on whether the problem either in male or only female, even both of them. There might be heavy biological problem if the duration was longer than 3 years.12-18

CONCLUSION

Patients’ age has an association with the number of antral follicles on IVF.
